DETAILED ACTION

Election/Restrictions

1. Applicant's election without traverse of Group I in the reply filed on 31 December 2004 is acknowledged.

2. Claims 34-55, 83-90 withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected inventions, there being no allowable generic or linking claim.

Election was made without traverse in the reply filed on 31 December 2004.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

- 4. Claim 82 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
- 5. Claim 82 recites the limitation "the timestamp" in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Application/Control Number: 09/840,472 Page 3

Art Unit: 2132

7. Claims 17, 65, 66 are rejected under 35 U.S.C. 102(e) as being anticipated by Vanstone, U.S. Patent No. 6,490,682. Referring to claims 17, 65, 66, Vanstone discloses a log-on verification protocol wherein a client generates a random number that is transmitted along with a data request to a server (Col. 3, lines 15-18), which meets the limitation of receiving a data object transmitted from the client to the server via the communications channel. The server then computes a hash on the concatenation of requested data and the random number (Col. 3, lines 18-20). The server then computes a signature on the hash using the private key of the client (Col. 3, lines 20-22), which meets the limitation of assigning a private key, stored at the server, to the client, processing object using a pre-determined hash function and the private key to generate a signature. Both the applet and the signature are then sent to the client (Col. 3, lines 22-23), which meets the limitation of assigning to the data object a descriptor containing a property field, the property field containing a signature filed, attaching the signature to the signature field associated with the data object to create a signed object.

Claim Rejections - 35 USC § 103

- 8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 9. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.

Application/Control Number: 09/840,472

Art Unit: 2132

2. Ascertaining the differences between the prior art and the claims at issue.

- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Page 4

10. Claims 1-5, 8-16, 18, 19, 22-31, 33, 56-64, 67, 68, 70-80, 91-99, 102, 103 are rejected under 35 U.S.C. 103(a) as being unpatentable over Vanstone, U.S. Patent No. 6,490,682, in view of Pfitzmann. Referring to claims 1, 2, 11-16, 18, 19, 22-31, 33, 56, 57, 59, 60, 62-64, 67, 68, 71-80, 91-95, 102, 103, Vanstone discloses a log-on verification protocol wherein a client generates a random number that is transmitted along with a data request to a server (Col. 3, lines 15-18), which meets the limitation of receiving a data object transmitted from the client to the server via the communications channel, the additional data is obtained from a device, the device receives the data object prior to subsequent processing by the server. The server then computes a hash on the concatenation of requested data and the random number (Col. 3, lines 18-20), which meets the limitation of the property fields further comprise additional data that is signed by a key private to the server, the additional data is derived by processing the data object using a predetermined hash function, transform function. The server then computes a signature on the hash using the private key of the client (Col. 3, lines 20-22), which meets the limitation of generating a signature by processing the data object, associating the signature with the data object to create a signed object, creating and managing private keys to use in the step of generating the signature, the server assigns a private key to the client. Both the applet and the signature are then sent to the client (Col. 3, lines 22-23). Vanstone discloses that the client verifies the validity of the signature, and not the server. Pfitzmann discloses a digital signature verification scheme that uses server aided generation and verification (Page 29), which meets the limitation of authenticating the signed object, subsequently upon request, deriving from the singed object

information representative of the data object and the signature, generating a comparison value using the information representative of the data object, determining whether the comparison value and at least a portion of the signature meet a predetermined criteria, property field further comprises key information used to generate the comparison value. It would have been obvious to one of ordinary skill in the art at the time the invention was made to verify the digital signature at the server where the signature was created because the system of Vanstone uses hardware tokens such as smartcards (Col. 2, line 25) and Pfitzmann discloses that using server-aided signing and verification is beneficial to systems utilizing smartcards in order to conserve computing power by delegating some of their computations to the server (Pfitzmann, Page 29).

Page 5

Referring to claims 3, 4, 58, 61, 96, Vanstone discloses that the server can authenticate the client using the client ID (Col. 2, lines 33-45), which meets the limitation of the client is authenticated by the server using information representative of the client.

Referring to claims 5, 97-99, Vanstone discloses that the client authentication utilizes a PIN (Col. 2, lines 26-27), which meets the limitation of the information representative of the client comprises a password provided by the client.

Referring to claims 8-10, Vanstone discloses the use of public key certificate authentication (Col. 2, lines 47-51), which meets the limitation of public key based processing step includes the presentment of a client certificate.

Referring to claim 70, Vanstone discloses that the client ID is used as an index in the server to find the associated private key (Col. 2, lines 34-39).

11. Claims 6, 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Vanstone, U.S. Patent No. 6,490,682, in view of Pfitzmann as applied to claims 1, 3 above, and further in Art Unit: 2132

view of Pavlik, U.S. Patent No. 6,807,633. Referring to claims 6, 7, Vanstone discloses a log-on verification protocol wherein a client generates a random number that is transmitted along with a data request to a server (Col. 3, lines 15-18), which meets the limitation of receiving a data object transmitted from the client to the server via the communications channel. The server then computes a hash on the concatenation of requested data and the random number (Col. 3, lines 18-20). The server then computes a signature on the hash using the private key of the client (Col. 3, lines 20-22), which meets the limitation of generating a signature by processing the data object, associating the signature with the data object to create a signed object. Both the applet and the signature are then sent to the client (Col. 3, lines 22-23). Vanstone discloses that the client verifies the validity of the signature, and not the server. Pfitzmann discloses a digital signature verification scheme that uses server aided generation and verification (Page 29), which meets the limitation of authenticating the signed object, subsequently upon request, deriving from the singed object information representative of the data object and the signature, generating a comparison value using the information representative of the data object, determining whether the comparison value and at least a portion of the signature meet a predetermined criteria. Vanstone and Pfitzmann fail to disclose using a secure channel such as SSL for client authentication. Pavlik discloses a digital signature system where a client is authenticated over a network by way of a SSL secure channel (Col. 6, lines 37-49). It would have been obvious to one of ordinary skill in the art at the time the invention was made to authenticate the client of Vanstone over an SSL secure channel so as to provide a digital signature system with electronic documentation, such as credit card information and/or bank account information as taught in Pavlik (Col. 6, lines 50-53).

Art Unit: 2132

Claims 20, 21, 32, 69, 81, 82, 100 are rejected under 35 U.S.C. 103(a) as being 12. unpatentable over Vanstone, U.S. Patent No. 6,490,682, in view of Pfitzmann as applied to claims 17-20 above, and further in view of Epstein, U.S. Patent No. 6,601,172. Referring to claims 20, 32, 32, 69, 81, 82, 100, Vanstone discloses a log-on verification protocol wherein a client generates a random number that is transmitted along with a data request to a server (Col. 3, lines 15-18), which meets the limitation of receiving a data object transmitted from the client to the server via the communications channel. The server then computes a hash on the concatenation of requested data and the random number (Col. 3, lines 18-20). The server then computes a signature on the hash using the private key of the client (Col. 3, lines 20-22), which meets the limitation of generating a signature by processing the data object, associating the signature with the data object to create a signed object. Both the applet and the signature are then sent to the client (Col. 3, lines 22-23). Vanstone discloses that the client verifies the validity of the signature, and not the server. Pfitzmann discloses a digital signature verification scheme that uses server aided generation and verification (Page 29), which meets the limitation of authenticating the signed object, subsequently upon request, deriving from the singed object information representative of the data object and the signature, generating a comparison value using the information representative of the data object, determining whether the comparison value and at least a portion of the signature meet a predetermined criteria. Vanstone and Pfitzmann fail to disclose the signed object containing a timestamp. Epstein discloses a digital signature transmission system wherein the signed documents contain a digital signature (Abstract & Col. 1, lines 11-18). It would have been obvious to one of ordinary skill in the art at the time the invention was made for the server of Vanstone to timestamp the signed object in order to

Art Unit: 2132

prove that no one has altered or revised the digital document since a certain date such as the alleged creation date or transmittal data of the document as taught by Epstein (Col. 1, lines 14-16).

Referring to claim 21, Vanstone discloses that the client ID is used as an index in the server to find the associated private key (Col. 2, lines 34-39).

Conclusion

13. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Dyson, U.S. Patent No. 5,050,212

Akiyama, U.S. Patent No. 5,805,699

Angelo, U.S. Patent No. 6,119,228

Yoshiura, U.S. Patent No. 6,131,162

Slater, U.S. Patent No. 6,796,489

Levi, U.S. Patent No. 6,804,778

14. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Benjamin E Lanier whose telephone number is 571-272-3805. The examiner can normally be reached on M-Th0 7:30am-5:00pm, F 7:30am-4pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron can be reached on 571-272-3799. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
